

Sourcing Analysis — Technical Challenge

8.2%

Mock Dataset · 601 candidates · Python + Claude AI

Overall Hire Rate · 49 / 601

601	67.9%	51.2%	38.9%	10.3%	79%
Sourced	Response Rate	Screen Pass	Interview Pass	Offer Rate	Offer Accept.

1. Approach

The analysis was structured around three core questions: **where do candidates convert best**, **what signals predict a hire**, and **where the funnel leaks most**. The dataset was loaded via Python (pandas + openpyxl), cleaned, and analyzed across all major dimensions — channel, recruiter, seniority, work mode, assessment scores, and role. Results are delivered as an interactive HTML dashboard.

Claude AI was used throughout: to generate hypotheses, validate non-obvious patterns, and write all natural-language recommendations in the dashboard.

2. Funnel Analysis

Stage	Candidates	% of Total	% of Previous
Sourced	601	100.0%	—
Responded	408	67.9%	67.9%
Screen Pass	308	51.2%	75.5%
Interview Pass	234	38.9%	76.0%
Test Taken	201	33.4%	85.9%
Offer Sent	62	10.3%	■ 30.8%
Hired	49	8.2%	79.0%

Critical drop: Test to Offer at 30.8% — the steepest bottleneck. Indicates misalignment between technical evaluators and hiring managers.

3. Channel & Recruiter Performance

Channel	N	Hire %	Recruiter	Sourced	Offers	Hire %
Github	73	11.0%	Bruno	98	15	15.3%
Inbound	69	10.1%	Ana	75	13	13.3%
Hunting	75	9.3%	Carla	101	12	8.9%
Banco de Talentos	68	8.8%	Gustavo	121	11	5.0%
LinkedIn	81	8.6%	Diego	103	6	4.9%
Comunidade	89	7.9%	Fernanda	103	5	3.9%
Evento	82	4.9%				
Indicacao	64	4.7%				

Bruno closes 100% of his offers (15/15). Gustavo generates 11 offers but closes only 6. Referral (Indicacao) underperforms at 4.7% — worth auditing intake quality.

4. Role as a Cross-Cutting Dimension

Channel effectiveness, seniority impact, and work mode conversion are not universal — they vary significantly by role. Analyzing these dimensions in isolation leads to **misleading conclusions**. A one-size-fits-all sourcing strategy loses conversion at every stage.

Role	Github	Inbound	LinkedIn	Banco T.	Hunting
An. Recrutamento	26.7%	17.6%	5.0%	21.1%	10.5%
People BP	11.8%	4.5%	0.0%	5.9%	12.5%
An. Dados	8.7%	13.3%	13.0%	0.0%	12.5%
TA Specialist	0.0%	6.7%	15.0%	6.7%	0.0%

Github converts at 26.7% for An. Recrutamento but 0% for TA Specialist. LinkedIn works for TA Specialist (15%) but fails for People BP (0%). Channel strategy must be role-specific.

Role	Junior	Pleno	Senior	Staff
An. Recrutamento	18.5%	4.2%	13.6%	15.4%
People BP	0.0%	9.0%	14.9%	4.5%
An. Dados	0.0%	9.8%	5.5%	11.1%
TA Specialist	0.0%	3.8%	4.7%	42.9%

Junior An. Recrutamento converts at 18.5% — above any global seniority average. People BP and An. Dados hire zero Juniors. The 'senior = safer' heuristic does not hold universally.

5. Use of AI

Hypothesis generation

Claude AI was used before writing any code to identify the most relevant analytical dimensions — including flagging role as a cross-cutting variable and the recruiter offer-close gap.

Pattern validation	Non-obvious findings (referrals underperforming, Junior An. Recrutamento outperforming, Github failing for TA Specialist) were validated through AI reasoning.
Insight writing	All natural-language recommendations in the dashboard were generated and refined with Claude, framed from a recruiter's perspective.
Score threshold rule	The Triple Score Rule (Tech ≥ 80 , Behavior ≥ 75 , Manager ≥ 75 -> 17.9% hire rate) was surfaced through AI-assisted pattern recognition and validated in data.

6. Key Insights & Recommendations

Test -> Offer: critical bottleneck	Only 30.8% of candidates who completed the test got an offer. Audit scoring alignment between tech reviewers and HMs.
Channel ROI depends on the role	Github: 26.7% for An. Recrutamento, 0% for TA Specialist. LinkedIn: 15% for TA Specialist, 0% for People BP. Sourcing must be role-specific.
Triple Score Rule: Tech ≥ 80 / Behavior ≥ 75 / Manager ≥ 75	Candidates clearing this threshold have a 17.9% hire rate — 2x the overall average. Use as a prioritization filter.
4x gap between top and bottom recruiters	Bruno: 15.3% hire rate, closes 100% of offers. Fernanda: 3.9%. Run a calibration session and share best practices.
No response = 58% of all rejections	A structured 2nd reach-out (3-5 days after first contact) could recover meaningful pipeline, especially in cold channels.
Seniority signal is role-dependent	Junior An. Recrutamento at 18.5% outperforms global averages. Junior People BP: 0%. Always combine seniority with role context.
Remote consistently underperforms — especially in some roles	An. Dados Remote: 1.9%. TA Specialist Remote: 2.4%. Hybrid is the top work mode across all roles (avg 10.8%).
Next step: predictive model per role	With more volume, a regression combining role + channel + seniority + work mode could make sourcing prescriptive rather than descriptive.
